

Pokémon Indigo - How to play on Android

1. Download the Emulator and Plugin

Download the JoiPlay emulator and the RPG Maker plugin from their Patreon

(<https://www.patreon.com/joiplay>). The newest versions are released there for free, though paid members receive them 14 days early. Avoid older builds from other sources, as the game requires recent updates to function correctly.

2. Add Your Game

Download the Pokémon Indigo ZIP file. Unzip the game folder using ZArchiver, as default file extractors may encounter errors with large files. Open JoiPlay, tap "Add Game," and select the "Game.exe" file located inside the unzipped folder.

3. Install RTP (First Launch Only)

Open the game. If JoiPlay prompts you for an "RTP", select and install the one for RPG Maker XP. This is only required on the initial boot.

4. The Initial Loading Screen

The game may stay on a "Loading..." screen for 3 to 10 minutes on the first launch. This is normal, especially if you enabled path cache, as the emulator is optimizing files for performance.

Updating or Transferring Your Save File

JoiPlay saves the game's save files in the games main folder. The save files will be named something like "Partida 1.rxdata." You can copy these files between folders or devices to update your game or transfer the save file.

EricLostie's Recommended Game Settings *

** Note: This step may be optional on newer JoiPlay versions. Try these if you experience issues though.*

Press and hold the game icon in JoiPlay and select "Settings". Have the following options enabled, and leave all other toggles off:

- Window Size: 512x384
- Font Scale: 1.00
- Vertical Screen Alignment: top-center
- Path cache: ON
- Pre-built path cache: ON
- Faster path enumeration: ON
- Solid Fonts: ON
- Use Ruby 1.8: ON

Optimize Maps

If you experience visual glitches or lag, press and hold the game icon in JoiPlay, scroll down, and select "Optimize Maps." Allow the process to finish.

Common Errors & Solutions

- **"Failed to load the bitmap..."**: The game unzipped incorrectly. Delete the folder and re-extract the ZIP using ZArchiver.
- **"undefined method 'zinflate' for MKXP:Module"**: Your JoiPlay version is outdated. Uninstall the app and download the latest version from the Patreon link in Step 1.
- **Black screen for 7-12 seconds during wild encounters**: Adjust the JoiPlay settings mentioned in Step 3.
- **The game lags**: Emulation requires significant system resources. If your device hardware is older, performance may be limited.
